Which paper proposes a novel method that could be utilized to attract the attention of, and ultimately communicate with, extraterrestrial intelligence?

Paper A : transit Light-Curve Signatures of Artifical Objects

Because it seems to suggest a pretty unique idea — like, using artificial planetary transits to actually send signals or get the attention of extraterrestrial civilizations. The concept is kind of new to me, but the idea that certain light-curve patterns could be engineered as a form of communication is really interesting. I'm not entirely sure how practical or detectable it would be in real life, but it definitely sounds like the kind of novel method the question is asking about.
